Pneumatocele after recovering from COVID-19

Hiroshi Sugimoto,1 Yukiko Era,2 Keisuke Sugimoto1

DESCRIPTION

A 50-year-old Japanese man presented at our hospital with a week-long history of fever and dry cough. He had never smoked and had no notable medical history. Chest CT revealed bilateral ground-glass opacities (figure 1A). The diagnosis of COVID-19 was confirmed by reverse transcription-PCR for SARS-CoV-2. We administered subcutaneous heparin and oral dexamethasone for 5 days; he was discharged on day eight of admission. Follow-up CT showed bilateral consolidations (figure 1B) 4 days after discharge. One week later, he experienced sudden chest discomfort and haemoptysis. Chest CT revealed a de novo pneumatocele in the right lower lobe (figure 1C), which was carefully managed conservatively as a complication of COVID-19.

Lung cystic changes occur in up to 10% of COVID-19 cases.1 Pneumatocele is a thin-walled cystic lesion associated with acute pneumonia, and it often resolves spontaneously.2 Ruptured pneumatocele can lead to pneumothorax3; thus, careful follow-ups should be required. Although the incidence and mechanism of pneumatocele formation are still unclear in COVID-19, diffuse alveolar damage due to SARS-CoV-2 infection followed by the necrosis of the airway walls can cause pneumatocele.2

Learning points

► Although the incidence and mechanism of pneumatocele formation are still unclear in COVID-19, diffuse alveolar damage due to SARS-CoV-2 infection followed by the necrosis of the airway walls can cause pneumatocele.

► We clinicians should be attentive to the occurrence of pneumatocele as a complication of COVID-19, and careful follow-ups are required because ruptured pneumatocele can lead to pneumothorax.

Contributors HS drafted the manuscript. YE and KS revised the manuscript.

Funding The authors have not declared a specific grant for this research from any funding agency in the public, commercial or not-for-profit sectors.

Patient consent for publication Obtained.

Provenance and peer review Not commissioned; externally peer reviewed.
