DESCRIPTION
An 80-year-old woman with a history of recurrent falls presented to the emergency department following a fall. On examination she was found to be tender at the C4/5 level. A cervical spine radiograph revealed no fractures, however, there was significant prevertebral soft tissue swelling which measured up to 3 cm (figure 1A). An occult fracture was suspected and a CT of the cervical spine was requested. No fracture was identified; however, there was an unexpected finding of an aberrant course of the internal carotid arteries which accounted for the prevertebral soft tissue thickening (figure 1B). The internal carotid arteries were found to be tortuous, medially displaced and almost met in the midline, a variant colloquially known as ‘kissing carotids’ (figure 2). Anatomical variations of the extracranial internal carotid arteries occur in approximately 5% of the general population1 and are a cause of non-traumatic prevertebral soft tissue thickening.

Figure 1 (A) Lateral cervical spine radiograph. Prevertebral soft tissue swelling (white arrows). (B) CT, sagittal plane in midline. Prevertebral soft tissue (white arrows) but visible prevertebral fat (black arrows).

Figure 2 CT, axial plane at level of C4. Internal carotid arteries (white arrows), jugular veins (black arrows).
Learning points

▸ In the trauma setting, the presence of prevertebral soft tissue swelling on a lateral cervical spine radiograph is a marker of occult vertebral fracture.
▸ The presence of prevertebral soft tissue thickening without a visible fracture should prompt a CT of the cervical spine.
▸ ‘Kissing carotids arteries’ are a non-traumatic cause of prevertebral soft tissue swelling which can mimic acute fracture in this setting.

Contributors FJG planned the study, obtained written consent, conducted the initial literature search, reviewed and edited the write-up and served as the overall supervisor. NSMG continued the literature search, reviewed the literature, produced the write-up, prepared the images used in the write-up with SWAW and submitted the manuscript. LAR conducted the initial literature search together with FJG, designed the structure for the write-up, reviewed and edited the final write-up. SWAW provided the interpretation of images, prepared the images used in the write-up, reviewed and edited the final write-up.
