DESCRIPTION

A 35-year-old man was admitted following daily vomiting for 2 weeks. He reported bouts of unexplained vomiting over the preceding 10 years. Gastroscopy showed obstruction in the second part of the duodenum with normal mucosa on biopsy (figure 1). CT demonstrated dilation of the first part of the duodenum caused by narrowing of the

second part (figure 2). There was no pancreatic mass. At laparotomy, a ring of pancreatic tissue was found encircling the second part of the duodenum causing obstruction (figure 3). This is a congenital abnormality known as annular pancreas. The annular pancreas was resected (figure 4). He was discharged 5 days after surgery and at subsequent outpatient review had no further vomiting. MRI 2 months after surgery showed an unobstructed duodenum (figure 5).

Annular pancreas occurs in 1 in 20 000 of the population. It develops during the fifth week of embryonic development when two lobes of a bilobed ventral pancreatic bud migrate in opposite directions around the duodenum. This may be caused by faulty hedgehog signalling.¹ Severe duodenal obstruction results in neonatal presentation. Moderate obstruction causes recurrent vomiting in adults usually between 20 and 50 years of age. Diagnosis may be made with gastroscopy,

CT and MRI² or at laparotomy. Excision of the annular pancreas relieves the duodenal obstruction and avoids complications such as stomal ulceration, which occur with gastrojejunostomy, suggested as optimal treatment in historical reports.³

Annular pancreas is uncommon but should be considered in the differential diagnosis of recurrent vomiting.

Learning points

- ▶ Annular pancreas is a rare congenital abnormality occurring in 1 in 20 000 of the population.
- ▶ Annular pancreas can present with recurrent vomiting in adults.
- ▶ Duodenal obstruction caused by an annular pancreas can be cured by resecting the annular pancreas surrounding the second part of the duodenum.

Contributors JL, JP and SP identified this case as worthy of publication because of its clinical importance. HV undertook the radiological investigations. All authors were involved in the literature search and in writing up the case report.
