Anomalous origin of the coronary artery from the pulmonary artery in a 33-year-old man

DESCRIPTION
A 33-year-old man, without prior history of coronary artery disease, was referred to a catheterisation laboratory with a diagnosis of non-ST elevation myocardial infarction. Coronary angiogram showed a dilated, dominant right coronary artery of normal origin with multiple collaterals draining to the left coronary system (figure 1A,B) and a coronary ‘steal’ phenomenon into the pulmonary artery (PA). Left main coronary artery (LMA) was not visualised on contrast injection into the aortic root (figure 1B). Ventriculogram showed ejection fraction of 40%–45% and anterior wall hypokinesis. Subsequent three-dimensional heart computer tomogram revealed anomalous origin of the LMA from PA, (figure 1C), confirming the diagnosis of anomalous origin of the coronary artery from the pulmonary artery (ALCAPA).

ALCAPA, also known as Bland-White-Garland syndrome, is a rare anomaly with estimated prevalence of 1:300,000 and high mortality rate in early childhood if left untreated. Very rarely it can be associated with other cardiac anomalies such as septal defects, coarctation of aorta, patent ductus arteriosus and tetralogy of Fallot.1 In our case, we did not see any other cardiac anomalies except redundant mitral leaflets with minimal prolapse (video 1). There are only a few survivors diagnosed in adulthood, presenting with various clinical symptoms, most commonly dyspnoea and angina.2 Surgery is the mainstream therapy. Our patient underwent left coronary artery (LCA) reimplantation to the aorta without complications. Successful treatment with coronary artery bypass grafting combined with LCA ligation from the PA was also reported.3

Video 1 Transthoracic echocardiogram with Doppler studies revealing trace mitral prolapse.

Learning points
► Anomalous coronary arteries as important differential diagnosis of chest pain in young population.
► The importance of diagnosis and treatment of anomalous origin of the coronary artery from the pulmonary artery to prevent mortality and mortality.
► The utilisation of three-dimensional heart computer tomography to establish the anatomy of anomalous coronary arteries.

Figure 1 (A) Left anterior oblique (LAO) view. Large dominating RCA with extensive collaterals to the left coronary system. (B) Failure to visualise left coronary artery on contrast injection to the left coronary cusp. (C) Three-dimensional computer reconstruction of coronary arteries showing anomalous origin of the left coronary artery system from the PA. Ao, aorta; LAD, left anterior descending artery; LCx, left circumflex artery; PA, pulmonary artery; RCA, right coronary artery.
